(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase and T4 polymerase and T4 high majar excess. The shate to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114[plbAFL29072.1]), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for amplcillin resistance."

Coli strain XL10-Gold, T1-resistant, F-"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus G75BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 Kb range using preparative agarose gal
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil4732114[gb]AR129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared with TH DNA polymerase and TH polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative asparose gel electrophoresis. Vector DNA was prepared from a derivative of pwd2 (gil4722114) (plAF129072.1), a copy.number inducible derivative of plasmid Rl. The vector was ligated inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide Kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwn42 (qi|4732114|qplART29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114) gblaF129072.1), a copyrnumber inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               // Acce="Vector: PWADAN; Purified genomic DNA from M. musculus C57BL/GJ (male) was obtained from the Jackson Laborator; PWADAN; Purified genomic DNA from M. musculus C57BL/GJ (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through 0.005 inch orifice at constant velocity. The sheared DNA was blunt endriepaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agances gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gild/321Hqib]AR129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                 Mouse whole genome scaffolding with paired end reads from 10kb.

```
Importatory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared bNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5. to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gil4732114 (gblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampliallin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end replated with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pwad (gil4732114(gblAF129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for amplicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                οy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /lab_host="E. Coli strain XL10-Gold, Tl-resistant, F-"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/60 (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarcse gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil4732114 gbjAR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Human Gene Signature, 3'-directed cDNA sequence. We are not:
submitting the same cDNA sequence redundantly to DDBJ since 1993.
For the abundance information of clones with this sequence in this
library and as well as in other 3'-directed libraries, see '
http://www.imcb.osaka-u.ac.jp/bodymap'. The sequences of the clones
represented by this GS sequences is also found there.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

            This sequence represents a Leptospira DNA sequence isolated from the pathogenic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species L. fainel. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for detection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a Leptospira DNA sequence isolated from the pathogenic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species L. fainel. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for detection and

This sequence represents a Leptospira DNA sequence isolated from the pathogonic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species L. fainel. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for detection and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         of Ureaplasma urealyticum infection. It provides novel genes (x99501-681) that can be used as a source of primers and probes for the detection and or quantification of U. urealyticum in a biological sample. The probes that can be used in the method of the invention by forming target: probe complex is copmolementary to a region selected from one of the 181 nucleic acid sequences (x99501-681). U. urealyticum is an opportunistic pathogen of the human urogenital tract that is a significant cause of the human urogenital tract that is a significant cause of the infections are commonly asymptomatic, it is important to have specific and sensitive methods for detecting their presence in a patient. Also, as the pathogen has no current antibiotic directed specifically against it, it would be advantageous to isolate and detect gene sequences which are unique to it, and utilise these as a basis for diagnosis of urealyticum infection as well as to develop new and improved drug
                                                                                                                                                                                                                                                                                                                                                                                                                              present invention provides methods for the detection and diagnosis
Ureaplasma urealyticum; nucleic acid detection; infection; pathogen; human urogenital tract; pregnancy; neonatal disease; drug therapy; suppurative arthritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapies. The present invention provides such novel polynucleotide

pathogenic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species L. fainei. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for prophylactic or detection and diagnosis of past or present LS infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a Leptospira DNA sequence isolated from the

                                 The present sequence encodes a heat shock protein, designated Hsp60-2. The protein, its fragments, variants and fusion proteins, are used to elicit or enhance an immune response against Streptococcus, and to elicit a similar response to a target antigen fused to the protein. Unlike other immunological carriers, Hsp60 proteins are not immunosuppressive so provide an increased response to any conjugated or fused antigen. Also, where used for cancer control, they lack the side effects associated with endotoxins. They can also be used to detect specific antibodies and in treatment or prevention of tumours (e.g. sarcoma or cancers of breast, overy, prostate, lung, pancreas or liver). The Hsp60 polynucleotide is used for recombinant production

Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in Y06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in Y06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
A probe based on the N-terminal sequence of B. sphaericus P-1 (LMG 9-13855) surface layer protein was used to screen an HindIII-generated library to isolate the slp gene. Promoter regions of the gene are used in genetic constructs providing surface expression of heterologous proteins in P-1 hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention provides isolated outer membrane proteins (OMP) from

The present invention describes a library of human polynucleotides comprising the sequences given in 21552 to 21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in 21253 to 21779. The polynucleotides can be used as a source of primers and probes, which be used for a variety of purpose, e.g. detection of expression levels, mapphing, tissue typing or profilling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrangements (wind succeed protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify a succeed protein); and to detect the invarience of an encoded protein); and to detect the invarience of an encoded protein); and to detect the invarience of an encoded protein).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cancer). The polynuclectides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detectidiseases related to Borrelia infections in animals, and for the .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This represents the nucleotide sequence of the breakpoint region on der(19) which reveals that the transcriptional orientation of the hydronephrosis (HNG) gene on the short arm of chromosome 6 is from the telomere to the centromere. A translocation partner to this gene on chromosome 6 is the chromosome 19 USF2 gene. The HNG gene can be used as a starting point to design suitable compounds or techniques for the diagnosing cells involved in renal diseases or disorders, or nucleotide probes for diagnosing cells involved in renal diseases and disorders. A protein or preparing suitable antibodies for diagnosing cells involved in renal diseases and disorders. The products and method can be used to treat or diagnose renal diseases and disorders and method can be used to treat or diagnose renal diseases.

                                                                                                                                                                                                                                                                                                                                                                                           T60349 and T60350 represent the coding sequences for the mitogen activated protein (MAP) kinases of the invention. The protein encoded by this sequence contains the T-E-Y sequence, in which the threonine and tyrosine residues are phosphorylated to activate the protein at residues 249-231. The MAP kinase and its gene can be used to regulate the synthesis of jasmone acid and the synthesis of a group of infectious synthesis of jasmone acid and the mAP kinase gene into a plant, thereby inducing expression of the mRNA for MAP kinase (or its antisense PNNA), the synthesis of jasmone acid and a group of infectious specific proteins can be regulated in the plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                       This is the nucleotide sequence of a virulence gene identified in Staphylococcus aureus mutant P15C11. S. aureus genes (see X07088-136) associated with virulence were identified by signature-tagged mutants containing a chromosomal insertion of a signature tagged transposon were generated, mutants with attenuated virulence were identified in amouse model of bacteraenia, attenuated virulence were identified in amouse model of bacteraenia, and the nucleotide sequences of the regions flanking the transposon insertion sites of these mutants were determined. Database sequence comparisons were performed to identify the virulence genes and to determine the possible function of their protein products (see also W97680-724). The P15C31 virulence gene product (see W97694) was identified as phosphoribosylformylgycinamic decarboxylasse Purt, an enzyme involved in purine biosynthesis. A claimed method of identifying an antibacterial agent involves assaying potential agents for the ability to interfere with the expression of S. aureus containing a functional mutation in one of the virulence genes, and its use in

The present sequence is that of cDNA coding for a novel human carbohydrate-associated protein, termed CRBAP-1 (see Y7956).

The cDNA (Incyte clone 714029) was initially identified in prostate tumour cDNA library PROSTUTO1. The sequence contains a single nucleotide polymorphism with C replacing T at position cases and at position 428 in 10% of the clones, and to 428 in 10% of the clones, and the case of the action of the clones and cell in 10% of clones. CRBAP-1 resembles vertebrate galactoside-binding vas identified in libraries associated with cancer and cell proliferation, inflammation and immune response, reproductive tissues and nervous tissues. The invention provides CRBAP-1 to -7 polymorbotides (see 294941-48) and polypeptides (see Y19505-11), as well as expression vectors, host cells, antibodies, agonists and antagonists. These are used in the diagnosis, treatment or prevention of disporders associated with CRBAP expression.

Sepecially autoimmune or inflammatory disorders, gastrointestinal clisorders, infectious disorders, reproductive disorders, and sorders, including cancer. CRBAP polynucleotides are useful sample from a patient. They may also be administered as part of
                                                                                                                                                                                                                                                                                                                      Novel carbohydrate-associated proteins used for the prevention and treatment of autoimmune/inflammatory disorders of e.g. the gastrointestinal and reproductive systems -

                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1, A

/Acce="Vector: palescript II XR; Site_1: EcoRI; Site_2:
XhoI; This cDNA library was constructed from mRNA isolated
from inmature flowers of field grown plants. The cDNA
library was prepared using the Stratagene pBluescript II
XR library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a poly
(dT) sequence with a XhoI restriction site. EcoRI adapters
were ligated to the blunt-ended cDNA fragments followed by
XhoI digestion. The cDNA fragments were directionally
cloned into the EcoRI-XhoI restriction site of the
pBluescript vector. The ligated cDNA fragments were
transformed into XLIO-Gold host cells, This library was
                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  L (bases 1 to 210)

The sequence contained an oligo-dr track that was present in the oligoucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site strand cDNA and therefore this may represent he NotI site olfactory bulbs tissue cDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BMAP cDNA clones from RESERCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant appropriate and limited collaborative arrangements
Seq primer: M13 Forward

Anote—"Vector: pTTT3D-Pac (Pharmacia) with a modified polylinker; 1st strand CDNA was prepared from mammary polylinker; 1st strand CDNA was prepared from mammary pland tissue from a lactating female, and was then primed with a Not I - Oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tel: +55-11-2704922
